

TECA-PRINT-PRODUCT INFORMATION

ECCENTRIC CLAMP-SYSTEM

with 3-sided clamping piece

The new eccentric clamp-system with 3-sided clamping piece is replacing the previous models with the round or 4-sided clamping piece.

The 3-sided clamping piece has three 12 mm sides which are used as stops to perfectly clamp the cliché or magnetic plate.

Magnetic plate or cliché are completely fixed and a knocking out of the clamping piece is avoided.

Additionally, the new eccentric clamp-system helps to level out small tolerance differences of clichés or magnetic plates. The three sides of the 3-sided clamping piece are marked with one, two or three points. Each side represents a different clamping distance.

Corresponding to the marking on the 3-sided clamping piece, the side with the suitable clamping distance can be chosen whenever there is a small space due to the normal tolerance of the plate.

The clamping distance is:
6,00 mm on the side with one point
6,25 mm on the side with two points
6,50 mm on the side with three points

Customers possessing existing machines with the rapid plate change system which are equipped with the previous models of the new 3-sided eccentric clamp-system (round or 4-sided clamping piece) can change to the new eccentric clamp-system easily.

The modification can be done at customer's site by experienced staff. With the part number 701 914 181 you will receive the necessary parts for the new eccentric clamp-system, see picture above.

Additionally you need a Loctite glue (available at Teca-Print) as well as some tools according to the attached modification plan. This modification plan is supplied also with each modification set.

Eccentric clamp-system modification set with 3-sided clamping piece, article no. 701 914 181

Beside from this modification set, a standard eccentric set is available, part number 701 914 180, see picture on the left. This set is suitable for all customers which would like to have an additional 3-sided clamping piece as replacement in stock.
